# Federal Highway Administration (FHWA) Coatings and Corrosion Laboratory (CCL): Ongoing Research on Coatings

Office of Infrastructure Research and Development  
FHWA CCL  
October 2023

Frank Jalinoos  
Coatings and corrosion lab manager  
Long-Term Infrastructure Performance Team

# Outline

- ▶ CCL expertise, mission, and research disciplines.
- ▶ CCL current coatings research projects:
  - ▷ Corrosion performance of metalized coatings over contaminated steel substrate.
  - ▷ Performance of coating systems used for preventive maintenance.

# Turner-Fairbank Highway Research Center Expertise

- ▶ Structural design and performance.
- ▶ Pavement design and evaluation.
- ▶ Safety design and operations.
- ▶ Human factors analytics.
- ▶ Connected vehicle technologies.
- ▶ Intelligent transportation systems.

Source: FHWA.

# Laboratories

## Safety

Federal Outdoor Impact Laboratory (FOIL)

Geometric Design Laboratory

Human Factors Laboratory

Safety Training Analysis Center (STAC)

## Operations

Saxton Transportation Operations Laboratory (STOL)

## Infrastructure

Aggregate and Petrography Laboratory

Asphalt Binder and Mixture Laboratory

Chemistry Laboratory

Coatings and Corrosion Laboratory

Concrete Laboratory

Geotechnical Laboratory

J. Sterling Jones Hydraulics Research Laboratory

Nondestructive Evaluation (NDE) Laboratory

Pavement Testing Facility

Structures Laboratory

Source: FHWA.

# CCL Goals

1. Conduct research to discover innovative solutions for the most critical materials-related problems that affect durability and serviceability of transportation infrastructure.
2. Focus on research that can yield field-applicable results.
3. Make the Nation's infrastructure safer and last longer by providing useful research products to stakeholders (e.g., State and local highway agencies, industries, and academia).

# Corrosion Modeling and Simulation

## Data sources:

- ▶ Construction documents.
- ▶ Field assessment.
- ▶ Laboratory testing.

## Modeling corrosion:

- ▶ Chloride ingress.
- ▶ Corrosion initiation and propagation.
- ▶ Corrosion damage to steel and concrete.

Source: FHWA.

# CCL Current and Recently Completed Coatings Research Projects

Highway Research Center

# Recently Completed Coatings Research Projects

- ▶ *Report on Industry-Recognized Corrosion Prevention Worker Certifications Effectiveness Evaluation, as Requested by the Senate Report 114-243 and House Report 114-606 (a congressionally mandated study) (Becker and Kogler 2019).*
- ▶ *Coating Performance on Existing Steel Bridge Superstructures (which focused on coating performance over chloride-contaminated substrates) (Liu and Runion 2020).*
- ▶ *Innovative Coating Removal Techniques For Coated Bridge Steel (which evaluated the performance of laser versus grit-blasting coating removal) (Fitz-Gerald et al. 2019).*

# *Coating Performance on Existing Steel Bridge Superstructures*

## Coating Performance on Existing Steel Bridge Superstructures

PUBLICATION NO. FHWA-HRT-20-065

McLean, VA 22101-2296

Source: FHWA (Liu and Runion 2020).

# Coating Performance on Existing Steel Bridge Superstructures (Continued)

- ▶ Evaluated four coatings over intentionally contaminated surfaces:
  - ▷ A three-coat system with an inorganic zinc-rich primer.
  - ▷ A three-coat system with an organic zinc-rich primer.
  - ▷ A two-coat system with zinc-rich primer with carbon nanotubes and urethane topcoat.
  - ▷ A one-coat system of high-ratio calcium sulfonate alkyd.
- ▶ Developed substrates with three levels of chloride contamination:
  - ▷ Control: less than 1- $\mu\text{g}/\text{cm}^2$ .
  - ▷ -20- $\mu\text{g}/\text{cm}^2$ .
  - ▷ -60- $\mu\text{g}/\text{cm}^2$ .

# Outdoor Exposure Testing

All photos source: FHWA.

Scribes in coating.

# Accelerated Lab Testing (ALT)

All photos source: FHWA.

Salt fog chambers

Ultraviolet chamber.

# ALT

All photos source: FHWA.

Rust creepage development on ALT panels.

Rust creepage measurement.

# Coating Performance—Conclusions

- ▶ The three-coat systems showed better tolerance of chloride than the two- and one-coat systems. The three-coat system with inorganic zinc primer had the best tolerance of chloride.
- ▶ The inorganic zinc primer performed slightly better than the organic zinc primer with chloride contamination levels up to 60- $\mu\text{g}/\text{cm}^2$ .
- ▶ Spraying saltwater did not affect the performance of the three-coat systems. The two-coat panels subjected to saltwater spray developed significant rust creepage, whereas the panels exposed to water spray did not exhibit noticeable creepage.
- ▶ Outdoor weathering simulates the natural exposure conditions experienced by steel bridges in service. However, the testing time should be significantly longer than ALT.

# Current Coatings Research Projects

- ▶ Corrosion performance of metalized coatings over contaminated steel substrate (metalizing/galvanizing performance over chloride-contaminated substrate).
- ▶ Performance of coating systems used for preventive maintenance.

# Corrosion Performance of Metalized Coatings Over Contaminated Steel Substrate

# Corrosion Performance of Metalized Coatings Over Contaminated Steel Substrate (Continued)

- ▶ Evaluate the performance of thermal spray coatings on contaminated steel substrates.
- ▶ Evaluate three coating types (i.e., zinc, aluminum, and zinc/aluminum (85-percent zinc and 15-percent aluminum)) over four levels of chloride contamination: 0-, 20-, 60-, and 100- $\mu\text{g}/\text{cm}^2$ .
- ▶ Coat the specimens with a top sealer.
- ▶ Stripe coat the edges with a seal coating.

# Metallization

Aluminum-coated panels after accelerated lab testing showing coating layer loss (panel number 001).

# Performance of Preventive Maintenance Coatings

# Scope of Study:

- ▶ Explore new and advanced coating materials for preventive maintenance and condition-based preservations.
- ▶ Evaluate novel surface cleaning methods that are field deployable (e.g., laser ablation).
- ▶ Explore field applications for maintenance coating.
- ▶ Evaluate the long-term performance of coating systems.

# Advanced Coatings for Preventive Maintenance

1. Single-component organic zinc coating: one-coat system containing 96-percent zinc in dry film.
2. Graphene-enhanced primer plus urethane topcoat: increased barrier performance in the primer.
3. Epoxy zinc-rich primer plus urethane topcoat: two-coat system with improved corrosion resistance.
4. Duplex coating system: metallizing plus durable organic coating.

# Laser Ablation for Surface Preparation

- ▶ Aims nanosecond-length pulses of laser light towards a surface (Adapt Laser n.d.).
- ▶ Turns contaminants or coating particles into a gas or peels them from the surface (Adapt Laser n.d.).
- ▶ Has benefits for surface preparation (Fitz-Gerald et al. 2019):
  - ▷ Is easy to operate (easily automated, quiet, and reliable).
  - ▷ Does not require surface cleanup.
  - ▷ Does not require containment.
  - ▷ Is safe and environmentally friendly.

# Laser Ablation for Surface Preparation (Continued)

*All photos source: FHWA.*

Before.

After.

Laser ablation for coating removal and surface preparation.

# Coating Systems: Single Coat

*All images source: FHWA.*

Single-component organic zinc coating.

# Coating Systems: Two Coat

*All images source: FHWA.*

- Zinc-rich primer.
- Graphene-enhanced primer.
- Laser-ablated steel surface.

# Coating Systems: Duplex Coatings

*All images source: FHWA.*

- The thermal spray (metalizing) zinc coating is on the abrasive blasted steel substrate.
- The topcoat provides extra barrier protection.

Google® search: “FHWA Corrosion Lab”

The screenshot shows a Google search interface. The search bar contains the text "FHWA Corrosion lab", which is circled in red. Below the search bar, the results show "About 173,000 results (0.35 seconds)". A search result snippet is displayed, starting with "The Coatings and Corrosion Laboratory researches the effects of corrosion and mitigation methods related to structural materials. The Lab also works to improve coating and corrosion test methods while gauging the durability and performance of innovative coating systems designed to prevent corrosion of steel bridges. Dec 2, 2019". Below the snippet, the URL "highways.dot.gov > research > laboratories > coatings-cor..." is visible, followed by a link titled "Coatings and Corrosion Laboratory Overview | FHWA". A blue arrow points from the search result snippet towards the right, indicating a transition to the FHWA website.

© 2020 Google.

The screenshot shows the FHWA website header with the logo and navigation menu. The main content area features a table titled "Topic: Coatings". The table has four columns: Title, Author(s), Publication Year, and Location. The first row lists a publication from 2020 by Rongtang Liu and Arthur W. Runion, Jr. The second row lists a report from 2019 by Donald R. Becker and Robert A. Kogler. To the right of the table, there is contact information for the Turner-Fairbank Highway Research Center and social media sharing options.

Title	Author(s)	Publication Year	Location
Coating Performance on Existing Steel Bridge Superstructures	Rongtang Liu, Arthur W. Runion, Jr.	2020	FHWA-HRT-20-065 September 2020
Report on Industry-Recognized Corrosion Prevention Worker Certifications Effectiveness Evaluation, as requested by the	Donald R. Becker and Robert A. Kogler	2019	Senate Report 114-243 and House Report 114-606, May 2019
