The purpose of this project is to enhance the safety of the highway and accommodate the anticipated traffic for the next 20 years. This rehabilitation project will:

- Preserve and extend the service life of the highway
- Provide climbing lanes
- Enhance safety
- Provide rock fall mitigation

As a part of this project’s ongoing National Environmental Policy Act (NEPA) environmental review process, FHWA is working on Environmental Assessment Re-evaluations for each construction phase of the Glenn Highway between MP 66.5 and 92.

The project team is currently developing the preliminary design and evaluating the environmental impacts of realigning the Glenn Highway to the south of Long Lake.

Through realignment, the highway will avoid the chronic rockfall area adjacent to Long Lake. Given the complexity of the corridor, the project team anticipates that environmental studies may take until 2024 at which time final design and Right of Way Acquisition processes will commence.

The project is not anticipated for construction until at least 2026.
